Laboratories Quarterly Surveillance Report

Quarter 2 of 2020

An Roinn Talmhaíochta, Bia agus Mara Department of Agriculture, Food and the Marine

Introduction

The veterinary laboratories operated by the Department of Agriculture, Food and Marine (DAFM) provide data on the patterns and frequency of occurrence of non-regulated diseases in farmed animal populations in Ireland. This disease surveillance role is fulfilled through routine diagnostic, post-mortem and targeted surveillance activities. Data from these activities are published collectively on a monthly, quarterly and annual basis. Recent quarterly reports and other surveillance reports can be accessed on DAFM's animal health surveillance website here: http://www.animalhealthsurveillance.agriculture.gov.ie/labreports/

The surveillance role of the laboratories complements the broader remit of DAFM in surveillance and control of diseases of animals. In addition to annual reports, periodical reports are published to ensure the timely feedback of accurate data to the relevant industry stakeholders to inform husbandry practices and disease control measures.

The quarterly surveillance reports are designed to provide a brief overview of disease trends in a given quarter. Further, and more detailed, commentary on individual cases or individual outbreaks can be accessed through monthly reports published in the Veterinary Ireland Journal and also available at: <u>Regional Veterinary Laboratory Reports</u>. Because of differences in the availability of test results and in the way cases are counted in the short term compared to the long term, there are often discrepancies between the figures reported in the quarterly reports compared to the annual report. However, quarterly report figures are directly comparable to the figures published for the same quarter in previous years. Similarly, the annual report figures are counted in the same way every year, and so the figures for each year are directly comparable. This is important when assessing trends in disease occurrence over time.

This Quarter

The data presented in this report refer to the second quarter of 2020 (April to June). Submission numbers were substantially lower compared to the same period in the past few years. The likely reasons include the limitation of DAFM laboratory activities to provision of the most essential services from mid-March on, in response to the COVID-19 pandemic; and the hot and dry weather which the country experienced during the period. Apparent trends in the data for this quarter need to be interpreted with caution. Apart from the smaller sample size, the prioritisation of cases by DAFM laboratories may have disproportionately reduced counts for conditions which tend to affect individual animals rather than groups of animals within the herd or flock.

In cattle, there were roughly three times as many positive results for rotavirus as there were for cryptosporidiosis in quarter one of 2020. The number of positive results for rotavirus again exceeded that for cryptosporidiosis in quarter two, although the difference was smaller. The relative increase in cases of cryptosporidiosis is not unexpected, as it is particularly associated with an accumulation of contamination of calving pens and young calf housing during the calving season, with resultant higher infection rates later in the spring. In sheep, pulpy kidney disease (PKD) was the most frequently diagnosed individual disease condition. The number of cases diagnosed was actually higher than that diagnosed during the same period in previous years. This is remarkable given that the number of sheep carcases examined was substantially smaller in Q2 of 2020. PKD is largely preventable by vaccination. Farmers are encouraged to vaccinate for clostridial diseases, especially where there is a history of unexplained or sudden deaths in the flock.

The weather in Quarter 2 of 2020

Figure 1: The average monthly rainfall (in millimetres) recorded for Quarter 2 of 2020 compared to the three previous years and the 30-year mean monthly rainfall (trend line). (Source: Met Eireann, www.met.ie).

Temperature

Figure 2: The mean monthly temperature (in degrees Celsius) for Quarter 2 of 2020 compared to the previous three years and the 30-year mean monthly temperature (trend line). (Source: Met Eireann www.met.ie).

Figure 3: The mean monthly soil temperature (in degrees Celsius) for Quarter 2 of 2020 compared to the previous three years. (Source: Met Eireann www.met.ie).

SPECIES	Carcass	Diagnostic	Foetus	Grand Total
Avian	346	68		414
Bovine	495	4360	61	4916
Canine	10	12		22
Cervine	34			34
Equine	4	52		56
Ovine	225	282	4	511
Porcine	85	40		125
Badger	40	11		51
Caprine	5	19		24
Exotic	5	10		15
Vulpine	1			1
Lagomorph	12	1		13
Grand Total	1262	4855	65	6182

Submission numbers to the RVLs in Quarter 2 of 2020

Table 1: The submission numbers of carcases, diagnostic samples and foetuses to the RVLs during Quarter 2 of 2020. Note that figures refer to sample numbers – one carcase or foetus counts as one sample under the carcase or foetus headings, one blood sample or faecal sample counts as one sample under the diagnostic heading.

Bovine disease surveillance

The causes of bovine mortality (all ages)

Figure 4: The causes of bovine mortality recorded on post-mortem examination in cattle of all ages by the RVLs, categorised by system or cause, during Quarter 2 of 2020 (n=368).

Figure 5: The ten most common individual diagnosed causes of death in cattle of all ages, recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=368).

Figure 6: The relative frequency of the most common individual bovine respiratory disease diagnoses, in cattle of all ages, recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=73).

Figure 7: The relative frequency of the most common individual bovine alimentary tract disease diagnoses, in cattle of all ages, recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=119).

Figure 8: The relative frequency of bovine clostridial disease diagnoses, in cattle of all ages, recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=5).

The causes of bovine mortality (age-specific)

Figure 9: The causes of bovine mortality in neonatal calves (calves aged less than one month) recorded on post-mortem examination by the RVLs, categorised by system or cause, during Quarter 2 of 2020 (n=118).

Figure 10: The causes of bovine mortality in calves (calves aged greater than one month but less than three months) recorded on post-mortem examination by the RVLs, categorised by system or cause, during Quarter 2 of 2020 (n=106).

Figure 11: The causes of bovine mortality in weanlings (bovine animals aged greater than three months but less than twelve months) recorded on post-mortem examination by the RVLs, categorised by system or cause, during Quarter 2 of 2020 (n=55).

Figure 12: The causes of bovine mortality in adults (bovine animals aged greater than or equal to twelve months) recorded on post-mortem examination by the RVLs, categorised by system or cause, during Quarter 2 of 2020 (n=78).

The relative frequency of pathogens identified in specific post-mortem examination diagnostic categories

Figure 13: The relative frequency of specific respiratory pathogens identified in bovine carcases examined on postmortem examination by the RVLs, in which a diagnosis of respiratory disease was made during Quarter 2 of 2020 (n=80).

Figure 14: The relative frequency of specific alimentary tract disease pathogens identified in bovine carcases examined on post-mortem examination by the RVLs, in which a diagnosis of 'enteritis' or 'gastro-enteritis' was made during Quarter 2 of 2020 (n=59).

Figure 15: The frequency of identification of *Clostridium* species on post-mortem examination of bovine animal carcases of all ages by the RVLs during Quarter 2 of 2020 .

The frequency of detection of enteric pathogens in neonatal bovine enteritis cases

Enteric pathogen	Negative	Positive	%Positive
E.coli K99	268	3	1.1%
Coronavirus	336	2	0.6%
Salmonella culture	338	0	0.0%
Cryptosporidium parvum	282	60	17.5%
Rotavirus	249	89	26.3%

Table 2: The relative frequency of detection of enteric pathogens in the faecal samples of neonatal calves (aged less than one month of age) harvested during Quarter 2 of 2020 both from clinically ill animals by veterinary practitioners in the field and from bovine carcases during post-mortem examination by the RVLs.

Results of the zinc sulphate turbidity (ZST) test in neonatal calves

Figure 16: The results of the ZST tests performed both on clinically ill animals and on carcases submitted for postmortem examination by the RVLs during Quarter 2 of 2020 (n=108). The ZST test is used to determine the immunoglobulin status of the calf which can reflect the extent to which maternal colostral immunity has been transferred to the calf *via* the colostrum. A value of greater than or equal to 20 units is considered indicative of adequate immunoglobulin levels in the calf.

Results of milk samples submitted for mastitis culture

Figure 17: The relative frequency of isolation of specific mastitis pathogens in milk sample submissions (n=478) for bacteriological culture by the RVLs during Quarter 2 of 2020.

Bovine abortion and perinatal death

Foetal diagnosis	Number	Percentage
Abortion	28	66.7%
Anoxia/Hypoxia	0	0.0%
Hereditary and developmental anomalies	2	4.8%
Mummification	0	0.0%
Stillbirth	0	0.0%
Perinatal mortality	0	0.0%
Placentitis	1	2.4%
Goitre	0	0.0%
Dystocia	0	0.0%
Bacteraemia/Septicaemia	3	7.1%
Weak calf syndrome	0	0.0%
Aspiration pneumonia	0	0.0%
Haemorrhage	0	0.0%
Miscellaneous causes	6	14.3%
No Diagnosis	2	4.8%
Total	42	

 Table 3: The causes of foetal (calves *in utero* up to 260 days gestation) or perinatal (calves from 260 days gestation to 48 hours post-delivery) death diagnosed on post-mortem examination (n=42) by the RVLs during Quarter 2 of 2020.

Figure 18: The relative frequency of detection of infectious agents in foetuses submitted to the RVLs for post-mortem examination during Quarter 2 of 2020 in which abortion, stillbirth or placentitis were diagnosed (n=29).

Ovine disease surveillance

Causes of ovine mortality

Figure 20: The ten most common individual diagnoses recorded in sheep carcases on post-mortem examination by the RVLs during Quarter 2 of 2020.

Figure 21: The relative frequency of respiratory disease diagnoses in sheep as recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=25).

Figure 22: The relative frequency of alimentary tract disease diagnoses in sheep as recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=52).

Figure 23: The relative frequency of clostridial disease diagnoses in sheep as recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=24).

Diagnosed cause of foetal death	Number Pero	centage
Abortion	3	75.0%
Miscellaneous causes	1	25.0%
Bacteraemia/Septicaemia	0	0.0%
Dystocia	0	0.0%
Goitre	0	0.0%
No Diagnosis	0	0.0%
Placentitis	0	0.0%
Perinatal mortality	0	0.0%
Mummification	0	0.0%
Hereditary and developmental anomalies	0	0.0%
Anoxia/Hypoxia	0	0.0%
	4	

Table 4: The relative frequency of the diagnosed causes of death in ovine foetuses recorded on post-mortem examination by the RVLs during Quarter 2 of 2020 (n=4).

Figure 23: The relative frequency of abortion agents identified in ovine abortion diagnoses (n=3) recorded on postmortem examination by the RVLs during Quarter 2 of 2020.
